## ADJUSTMENT

### ADJUSTMENT OF METER RANGE

1. Connect a dummy resistor and an SSVM to the speaker terminals and an AG (1 kHz) to the AUX terminal.
2. Set the meter range on the panel to 80W.
3. Use AG and volume control to obtain a setting of 50W (20V/8 $\Omega$ ).
4. Turn trimming potentiometer VRm7, 8 until 50W is indicated on the power meter.

### ADJUSTMENT OF BIAS CURRENT

1. Turn the volume control to fully counterclockwise.
2. Connect a voltmeter to terminals 10, 11 of the power amplifier.
3. Turn trimming potentiometer VRm5 (left channel) until the voltmeter indicates 20 mV approximately.
4. Change voltmeter connections to terminals 12, 13 and turn trimming potentiometer VRm6 (right channel) until the voltmeter indicates 20 mV.

**Note**

Resistors except the special type (example: cement, metal film, etc.) are not detailed in PARTS LIST. With regard to the value, refer to the schematic diagram or the PC board illustration.

Resistors not detailed are carbon type (1/4W or 1/8W).

You should give an order for the carbon resistors according to the ways described as follows:

A carbon resistor's part number is example RD14BY 2E 22J

## 1. Kinds of the carbon resistor

RD14BY

RD14CY

## 2. Wattage

1/4W  $\rightarrow$  2E

1/8W  $\rightarrow$  2B

## 3. Resistance value

Significant figure Multiplier

Example:

221  $\rightarrow$  220 $\Omega$

222  $\rightarrow$  2.2k $\Omega$

223  $\rightarrow$  22k $\Omega$

224  $\rightarrow$  220k $\Omega$

225  $\rightarrow$  2.2M $\Omega$

## 4. Tolerance

J =  $\pm$ 5% (Gold color)

K =  $\pm$ 10% (Silver color)

## ADJUSTMENT

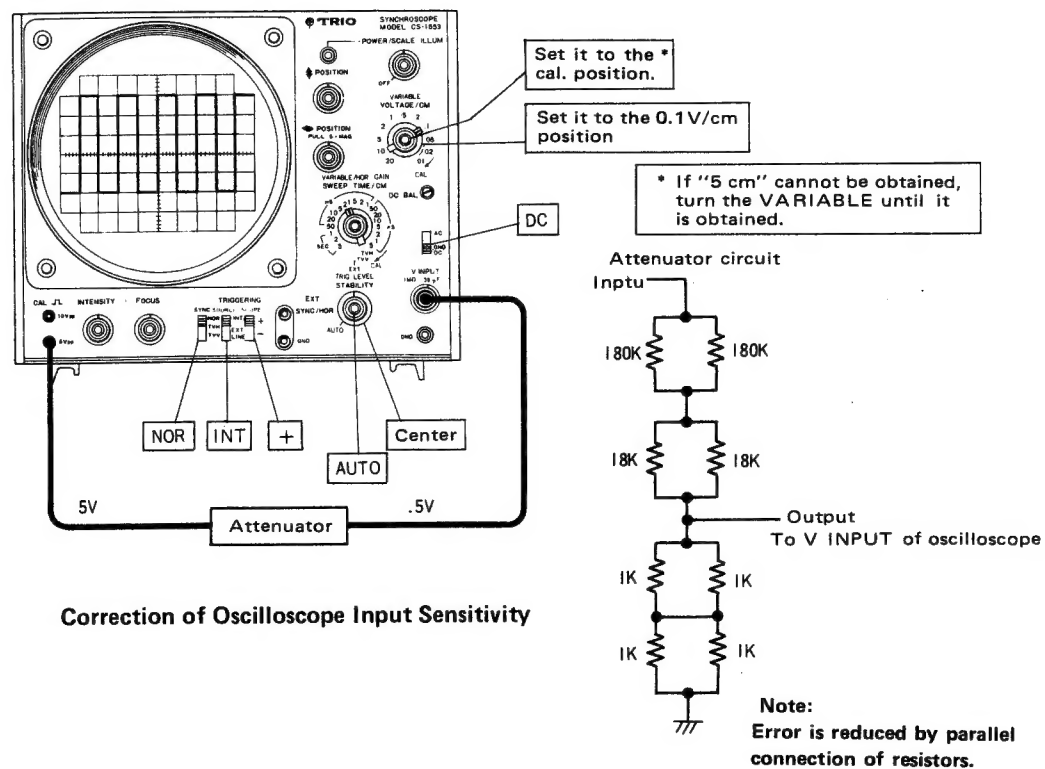

### ADJUSTMENT OF BIAS CURRENT USING AN OSCILLOSCOPE

Power transistors recently produced generally have low emitter resistance values. Therefore, adjustments become difficult to achieve since an inverted Darlington circuit is adopted in the KA-6100 and meter deflections on VOM, etc. are generally smaller than those in conventional equipment. In such a case, the following adjustments are possible.

#### Adjustment Procedure (Method by means of oscilloscope CS1553)

1. Correct the input sensitivity of the oscilloscope.
2. Connect the oscilloscope to the test point (Nos. 10, 11 for the left channel and Nos. 12, 13 for the right channel).
3. Turn the volume control to interrupt the entry of signals into the power amplifier.
4. Turn the trimming potentiometer (VRm5 for the left channel and VRm6 for the right channel) until 20 mV is indicated.
